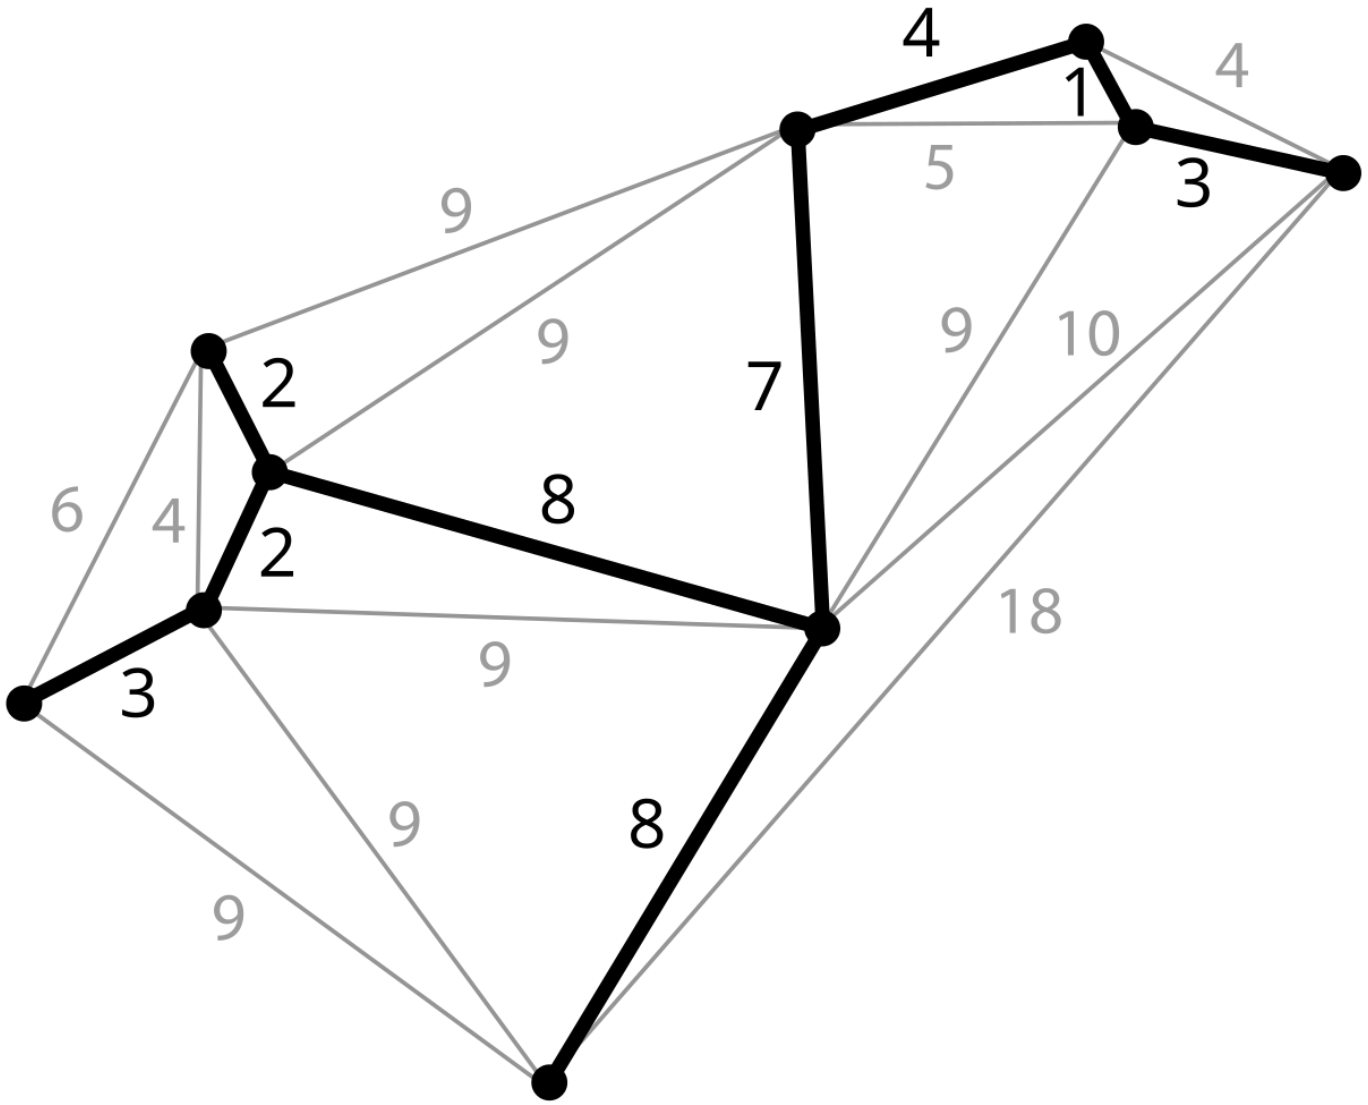
Kruskal’s Minimum Spanning Tree Algorithm

Ksawery Kochanowicz – Final project presentation

Introduction to the problem

- MST – a connected subgraph without cycles, which the sum of the weights of all the edges is minimal



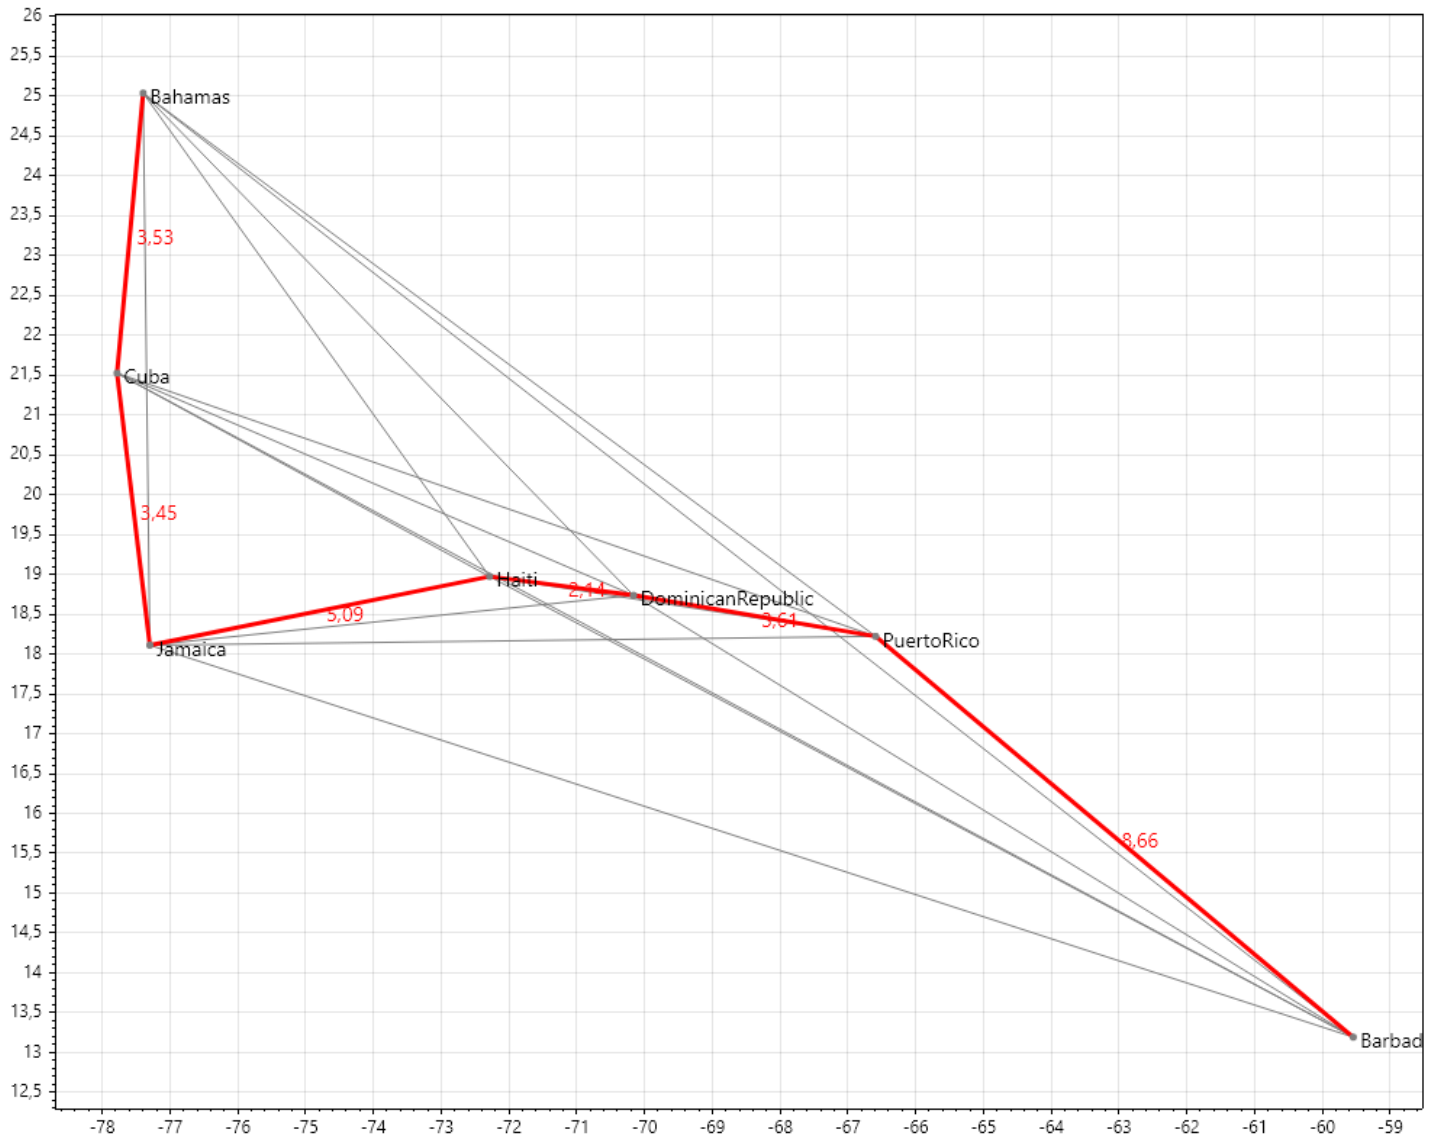
Implementation

- Changes to DataSctructureLibrary
- Kruskal's Default solution
- Kruskal's Coordinates solution & Graph generation
- Practical application

Challenges & solves

Understanding the algorithm and coding it, choosing correct data structure to store the disjoint set

Understanding the DS library from lectures, and tuning it to my project

Reflection


- I enjoyed the project a lot, especially the freedom I've got to implement a practical solution of my choosing.
- Working on the implementation required me to do plenty of additional research, which I feel like improved my knowledge a lot, and also got me hooked on researching different graph traversal algorithms.
